

SUMMARY

Software engineer with hands-on experience in **scalable ETL processes**, **relational modeling (PostgreSQL and MySQL)**, and **cloud fundamentals (AWS)**. Specializing in the development of efficient data pipelines and optimizing database performance. Committed to architecting high-availability data solutions and continuously improving technical skills.

WORK EXPERIENCE

EPAM Systems - Data Analytics Engineering Trainee | *Global (Remote)* 2025/10 - Present

- Architected scalable ETL processes and operationalized data ingestion pipelines, achieving an 80% improvement in loading efficiency.
- Constructed Star Schema models in **AWS Redshift**, slashing query latency by 90% through optimized distribution and sort strategies.
- Utilized **AWS S3** for raw data storage and **AWS Athena** for serverless querying, ensuring a cost-effective and high-performance data lake architecture.
- Authored PL/pgSQL functions in PostgreSQL to automate complex data cleansing and transformation workflows across multiple data sources within the warehouse.
- Created detailed logical and physical data models using Draw.io, facilitating clear entity relationships and ensuring 3NF normalization standards.
- Completed projects by undergoing regular peer code review processes in an international, English-speaking Agile environment, under the supervision of foreign mentors.

Orris Academy - Software Developer | *Turkey (Freelance)* 2024/05 - 2025/01

- Implemented API-based data ingestion pipelines to collect high-frequency user interaction events (likes, gifts, emojis) from social platforms, enabling real-time event processing for interactive applications.
- Built event-driven data workflows to process and distribute streaming user activity data across multiple live applications, supporting low-latency interactions during high-traffic events (5,000+ concurrent users).

EDUCATION

BSc Software Engineering 2021 - 2025 *Izmir University of Economics* Izmir, Turkey

PROJECTS

End-to-End Omnichannel Retail Data Warehousing & Analytics | [EPAM Systems Training Project](#) 2025/01 - 2026/05

- Established a scalable data lake on **AWS S3** to store processed retail datasets, utilizing **AWS Athena** for serverless ad-hoc querying and schema-on-read analysis.
- Streamlined ETL processes by leveraging **PostgreSQL stored routines**; improved data loading efficiency by 80% while ensuring data integrity and cleansing across diverse datasets.
- Accelerated **Redshift** cluster performance by implementing strategic Distribution Styles and Sort Keys, resulting in a 90% reduction in query execution time.
- Built an advanced **Power BI** dashboard with complex **DAX** measures (Time Intelligence, Ranking) to provide actionable insights into retail sales performance.

Smart Tourism Analytics Platform for Overcrowding Prediction | *Data Engineering Project* 2026/06 - Present

- Designed and implemented a containerized batch data pipeline to ingest hourly traffic, weather, event, and flight data from 4 external **APIs** for tourism analytics.
- Orchestrated ingestion workflows using **Apache Airflow** and stored raw datasets in a **Dockerized PostgreSQL** database for structured processing.
- Built staging models with **dbt** to clean and standardize heterogeneous raw data for downstream analytics.

Data Analysis of Job Loss Due To AI | [MATH 485 Term Project](#) 2025/05 - 2025/06

- Conducted a comprehensive study on the disruptive impact of AI on job loss by performing data preprocessing on multi-sector datasets in **RStudio**, processing multi-dimensional data to ensure structural consistency for analysis.
- Applied non-parametric methods, including **Spearman's Rank Correlation** and **Chi-Square tests**, to examine dependencies between AI adoption rates and industry-specific job displacement, identifying hidden patterns across diverse sectors.
- Visualized correlation matrices and trends in **R** to conclude that while AI poses a threat to routine-heavy roles, it acts as a catalyst for new skill-sets, providing a quantitative basis for predicting future workforce transitions.

Vision-Guided Autonomous Restaurant Robot | *Graduation Project*

2025/02 - 2025/06

- Executed an end-to-end computer vision pipeline by training a **YOLOv8** model on curated datasets and deploying it on **Raspberry Pi 4**, optimizing SDK environments and hardware-software communication to achieve low-latency, real-time autonomous navigation.

CERTIFICATIONS

Data Analytics Engineering | EPAM Systems

Data Analysis Bootcamp | Global AI Hub

Power BI: Integrating AI | LinkedIn

AWS Essential Training for Developers | LinkedIn

SKILLS

Programming Languages: Python, SQL, R

Data Engineering & Orchestration: Apache Airflow, dbt, Docker, Git

Databases & Warehousing: PostgreSQL, MySQL, AWS Redshift, AWS DynamoDB

Cloud Services (AWS): Amazon S3, Amazon Athena, Amazon RDS, Amazon EC2, AWS Lambda

Analytics & Data Science Tools: Pandas, NumPy, Scikit-Learn, Matplotlib, Power BI (DAX), DBeaver

Methodologies: ETL Pipeline Design, Star / Snowflake Schema Modeling, Agile / Scrum

VOLUNTEERING EXPERIENCE

Izmir University of Economics - Student Mentor | *Izmir, Turkey (On-Site)*

2023/08 - 2024/02

- Supported first-year students during academic onboarding by providing guidance on course selection, university processes, and adaptation to campus life.
- Coordinated orientation activities to improve student engagement and transition experience in the first semester.

LANGUAGES

- Turkish - Native
- English - B2
- Greek - A2
